Project Documentation — Import Data using Transform Maps

Date	01 October 2026
Team ID	SWTID-2026-8578
Project Name	Import Data using Transform Maps
Maximum Marks	Reference / Detailed

1. Project Description

This micro project demonstrates importing structured employee data from an external spreadsheet into ServiceNow using Import Sets and Transform Maps. The spreadsheet is loaded into a staging Import Set table, source fields are mapped to a custom target table, and the transformation creates or updates employee records. Coalesce is then used to avoid duplicate records during repeated imports. Reports and a dashboard provide visibility into employee data.

2. Project Objects

Object	Name	Purpose
Target Table	Employee Test (u_employee_test)	Stores final employee records.
Import Set Table	Employee Import (u_employee_import)	Stages spreadsheet data before transformation.
Transform Map	Sample Spreadsheet Import	Maps Employee Import to Employee Test.
Key Match Field	Employee ID	Coalesce field for repeated imports.
Reports	Employees by Department; Employees by Location; Employee List Report	Summarize and list employee data.
Dashboard	Employee Analytics Dashboards	Centralize the three reports.

3. End-to-End Workflow

Prepare Sheet → Load Data → Employee Import → Create Transform Map → Auto Map / Mapping Assist → Transform → Employee Test → Transform History → Reports → Dashboard

4. Target Table Fields

Field	Type	Purpose
Employee ID	String	Unique matching identifier; used for Coalesce.
Employee Name	String	Employee name.
Email	String	Employee email address.
Department	String	Department classification.
Location	String	Employee location.

5. Transformation and Coalesce

The Transform Map named Sample Spreadsheet Import uses Employee Import as the source and Employee Test as the target. Source and target fields are mapped. Coalesce is enabled on one field, specifically Employee ID in the documented conclusion, so an existing Employee ID is matched instead of creating a duplicate record.

6. Documented Validation Scenario

The source document describes a second Excel import containing four rows: two rows use existing Employee IDs with changed values, and two rows are new IDs. After transformation, the documented result is 2 inserted records and 2 updated records. When the same sheet is uploaded again, the documented result is 0 inserted, 0 updated and 4 ignored rows.

7. Reports

Report	Type	Configuration
Employees by Department	Pie Chart	Table: Employee Test; Group by: Department; Aggregation: Count.
Employees by Location	Bar Chart	Table: Employee Test; Group by: Location; Aggregation: Count.
Employee List Report	List	Columns: Employee ID, Employee Name, Email, Department, Location.

8. Dashboard

Dashboard name: Employee Analytics Dashboards. The three reports are added to the dashboard so administrators/HR users can view department distribution, location distribution and the employee list in one place.

9. Step-by-Step Implementation

• Prepare a Google Spreadsheet with sample employee data and download it as an Excel file.

• Create the Employee Test custom table with the required employee fields.

• Open Load Data and create the Employee Import Import Set table.

• Create the Sample Spreadsheet Import Transform Map.

• Use Auto Map Matching Fields and Mapping Assist to map source and target fields.

• Save and run Transform.

• Open Employee Test to verify imported records.

• Enable Coalesce on Employee ID in the Transform Map Field Maps.

• Upload a new Excel file and run the transform again to observe inserts/updates.

• Repeat the same upload to observe ignored rows for already processed identical data.

• Create the three reports.

• Create Employee Analytics Dashboards and add the three reports.

10. Conclusion

The project implements an automated employee data management workflow using ServiceNow Import Sets and Transform Maps. It covers data loading, field mapping, transformation, duplicate prevention through Coalesce, validation through Transform History, and visualization through reports and a dashboard.

The supplied source document emphasizes data integrity: enabling Coalesce on Employee ID allows repeated imports to update existing records instead of inserting redundant entries. The reporting/dashboard extension provides a centralized view of employee information and import outcomes.

11. Source Scope Note

This documentation is customized from the supplied project PDF. Where the source does not provide team-member names, repository URLs, hosting URLs, or numeric performance measurements, this submission does not invent them.
